

I. SUMMARY

Technical lead and full-stack engineer with five years building third-party risk software for tier-1 US financial institutions, across a **Python**, **.NET** and **React** stack. At S&P my strongest work has been leading the execution of our architect's **Azure-to-AWS** migration strategy within a team of six, architecting a real-time sync layer across React and .NET, and building the **AI-native tooling** I run my own delivery work on. On the side I have built agora.new architecture end to end, the application and the **AI-native workflow** that develops it, plus open-source tooling including **chorale**, a Rust table library shipped to crates.io in a language I didn't hand-write, and **Camerata Orchestrator**, the fullest display of my philosophy. I work with teams across the US, Europe and India time zones.

II. PROFESSIONAL EXPERIENCE

🔗 **S&P Global Market Intelligence (previously TruSight Solutions)** **Feb 2021 – Present**
 Technical Lead Remote, USA & EMEA

- **Scope & Trajectory**
 - ▶ Technical lead on a six-engineer team building third-party risk-assessment software relied on by tier-1 US financial institutions. I own the team's day-to-day technical decisions, standards and design choices, unblock engineers and review code and architecture, while working from both the US and Europe.
 - ▶ Joined in 2021 and was retained through the **2023 acquisition** by S&P Global Market Intelligence, advancing from **Applications Engineer** through Software Engineer I and II to **Technical Lead**.
 - ▶ Run QA across the team with no dedicated QA engineer, and took over day-to-day **Product Owner** duties after a vacancy, running ceremonies and managing the backlog.
- **AI-Native Delivery Tooling**
 - ▶ Built a local story-generation tool that drives the **Claude Code** CLI from inside the application, to close the gap left by the vacant Product Owner role. It sorts work across the full set of story types the team writes against, from UI and API through **RBAC** permissions and infrastructure, with a catch-all for anything not yet modelled. It builds the whole feature to child-story structure and asks clarifying questions before writing anything.
 - ▶ Integrated end to end with **Azure DevOps**: pull by story ID or push new ones, carrying the full field mapping, from the parent feature link through story points and sprint.
- **Python Services**
 - ▶ Supported a set of 14 **Azure Function** apps written in **Python**. Folded them into a **FastAPI** microservice during the AWS migration, now deploying to **AWS ECS**.
 - ▶ Support a standalone Python service that redacts uploaded files by type.
 - ▶ Wrote and maintain the team's Python application-support scripts.
- **.NET Backend**
 - ▶ Build and maintain the platform's **.NET** API surface: endpoints, service layers and the data access behind the third-party risk workflows our customers run.
 - ▶ **Architected** a **SignalR** WebSocket layer linking the React frontend, .NET backend and **Azure WebJobs**, so users saw live updates without refreshing the page.
 - Wrote a custom **"Service-as-Client"** API proxy authenticated with **Okta** service-to-service tokens, which let internal services reach the WebSocket hub securely.
- **React Front End**
 - ▶ Build customer-facing features across the **React** application, from the component layer through to the API integration behind them. Drove the build stack from **Node 12 to Node 20** and **React 16 to 18**, fixing breaking changes including **AG Grid** and migrating ~350 Enzyme tests to **React Testing Library** with AI-assistance.
- **Azure-to-AWS Migration**

- Owned execution of the architect's **Azure-to-AWS** migration strategy: broke it into the engineering plan, wrote the stories, delegated across the team and coordinated 7 contractors by scoping and reviewing their work, while keeping the production Azure platform stable throughout.

The New Agora (Independent Project) **Nov 2025 – Present**

Creator & Lead Engineer

Remote / Global

agora.new

- **Built End to End**
 - Built and run the platform, every layer from the database to the UI, plus the deploy pipeline and the agent workflow that develops it. It is **live in production**, with real applicants using it to apply to **INTBAU** summer-school programs. Rebuilt an early **Supabase** prototype onto a normalized **PostgreSQL** schema with strictly separated service layers, so I can add modules without the design drifting.
- **AI-Native Workflow**
 - Run the codebase through scheduled agents for code review, bug triage and dependency-vulnerability sweeps. The architecture's rules live in **lint and CI**: layer boundaries, migration-safety checks, secret scanning and audit-field gates. High-risk, one-way-door changes (auth, payments, migrations, schema) always come to me before they merge.
- **Infrastructure & Security**
 - Stood up all three environments (dev, staging, prod) on **Azure** with **Terraform**: App Services, managed Postgres and networking. Designed **RBAC** with system- and organization-scoped permissions over multi-factor auth (**TOTP, email OTP, passkeys**), with secrets centralized in **Azure Key Vault** per environment.

III. PROJECTS & WRITING

- **Camerata Orchestrator** · [GitHub Link](#)
 - An in-progress, provider-neutral governance engine for AI coding agents in Rust: the **guardrails and evaluation** that keep **multi-step agent workflows** grounded, safe and cost-controlled.
 - Guardrails**: a **deny-before-execute MCP gateway** blocks a forbidden **tool call** before it reaches disk, reproducible end to end from the CLI. A post-task structural check bounces violations back for revision. The decision is deterministic, never the model's own judgment.
 - Grounding and drift**: a verification ladder (**Draft, Grounded, Verified**) tracks whether each rule is still backed by a cited source or real linter rule. Verified is human-only, and **drift demotes it to NeedsRecheck**.
 - Cost and audit**: a provider-neutral LLM layer with a **usage ledger** metering tokens, calls and dollars per model. Its brownfield audit scans a codebase against deterministic security checks and an AI architectural review, reporting violations with severity and rule provenance.
 - A **22-crate** workspace with **3,400+ tests**, held to a strict CI bar on its own source (unsafe forbidden, unwrap denied workspace-wide, clippy and fmt enforced).
- **Chorale** · [Live Demo](#) · [GitHub Link](#): a headless, virtualized table library for **Rust (Dioxus & Leptos)**, published to crates.io. Orchestrated with AI end to end and held to a production bar: clippy-pedantic-clean, 427 passing tests, unsafe forbidden. Built to demonstrate that AI orchestration can hold a real quality standard.
- Writing: essays on AI-native architecture and standards-as-code, including **Architecture as Law** and **Codifying Less Is More**. Full list at [Medium](#).

IV. ELIGIBILITY AND LOCATION

Status: United States Citizen · Location: New York City · Availability: Fully Remote

V. EDUCATION & CERTIFICATIONS

Microsoft: **Azure Developer Associate (AZ-204)**, Dec 2024 · **Azure Fundamentals (AZ-900)**, June 2022

FullStack Academy: Web Development Certificate, New York, NY, 2020 · Rutgers University: B.S. in Public and Non-Profit Administration, Summa Cum Laude, 2015 to 2018
