

I. SUMMARY

Technical lead and full-stack engineer with five years building third-party risk software for tier-1 US financial institutions, on a .NET and React stack. Most recently I built agora.new architecture end to end: the application, the AI-native workflow that develops it, the CI/CD, and the Terraform-managed environments behind it. At S&P my strongest work has been leading the execution of an Azure-to-AWS migration within a team of six and a real-time sync layer I designed across React and .NET. I also publish open-source tooling, including chorale, a Rust table library I built to production and shipped to crates.io in a language I didn't hand-write, using AI orchestration. I work with teams across the US, Europe and India time zones.

II. PROFESSIONAL EXPERIENCE

🔗 **S&P Global Market Intelligence (previously TruSight Solutions)** **Feb 2021 – Present**
 Technical Lead Remote, USA & EMEA

- **Scope & Trajectory**
 - ▶ Technical lead on a six-engineer team building third-party risk-assessment software relied on by tier-1 US financial institutions. I own the team's day-to-day technical decisions, standards, and design choices, while working from both the US and Europe.
 - ▶ Joined in 2021 and was retained through the **2023 acquisition** by S&P Global Market Intelligence, advancing from **Applications Engineer** through Software Engineer I and II to **Technical Lead**.
- **Real-Time Sync Layer**
 - ▶ Designed a **SignalR** WebSocket layer linking the **React** frontend, **.NET** backend, and **Azure WebJobs**, so users saw live updates without refreshing the page.
 - ▶ Wrote a custom **"Service-as-Client"** API proxy authenticated with **Okta** service-to-service tokens, which let internal services reach the WebSocket hub securely.
- **Azure-to-AWS Migration**
 - ▶ Owned execution of the architect's **Azure-to-AWS** migration strategy: broke it into the engineering plan, wrote the stories, delegated across the team, and coordinated 7 contractors by scoping and reviewing their work.
 - ▶ Hands on: built a Python **FastAPI** service and its Dockerfile to replace a set of 14 **Azure Functions**, now being deployed to **AWS ECS**, while keeping the production Azure platform stable through the transition.
- **Leadership & Delivery**
 - ▶ Unblock engineers, review code, and keep engineering standards consistent across the team.
 - ▶ Ran QA across the team when there was no dedicated QA engineer, and took over day-to-day **Product Owner** duties after a vacancy, running ceremonies and managing the backlog to keep delivery on track.
- **Front-End Modernization**
 - ▶ Earlier in my tenure, as a Software Engineer, drove the front-end build stack from **Node 12 to Node 20** and the UI from **React 16 to 18**, working through the full cascade of dependency breaking changes it set off and keeping a data-heavy **AG Grid** stable.
 - ▶ Migrated ~350 Enzyme tests to **React Testing Library** with **AI-assisted refactoring**.

 **The New Agora (Independent Project)** **Nov 2025 – Present**
 Creator & Lead Engineer Remote / Global
 agora.new

- **Built End to End**
 - ▶ Built and run the platform, every layer from the database to the UI, plus the deploy pipeline and the agent workflow that develops it. It is **live in production**, with real applicants using it to apply to **INTBAU** summer-school programs.

- Rebuilt an early **Supabase** prototype onto a normalized **PostgreSQL** schema, keeping the service layers strictly separated so I can add modules without the design drifting.
- **AI-Native Workflow**
 - Run the codebase through scheduled agents for code review, bug triage, and dependency-vulnerability sweeps. The architecture's rules live in **lint and CI**: layer boundaries, migration-safety checks, secret scanning, and audit-field gates.
 - High-risk, one-way-door changes (auth, payments, migrations, schema) always come to me before they merge.
- **Infrastructure & Security**
 - Stood up all three environments (dev, staging, prod) on **Azure** with **Terraform**: App Services, managed Postgres, and networking.
 - Designed **RBAC** with system- and organization-scoped permissions over multi-factor auth (**TOTP**, **email OTP**, **passkeys**), centralized secrets in **Azure Key Vault** per environment, and wrote secret-injection tooling that keeps local development credential-free.

III. OPEN SOURCE & WRITING

- Chorale - **Live Demo** · **GitHub Link** - a headless, virtualized table library for **Rust (Dioxus & Leptos)**, published to crates.io. I orchestrated it with AI end to end, held to a production bar: clippy-pedantic-clean, fully tested (including 429 passing tests), unsafe forbidden. Built to demonstrate that AI orchestration can hold a real quality standard, not just move fast.
- Camerata - **GitHub Link** - a personal project that codifies the architectural approach I use, packaged as a **Rust CLI and Dioxus GUI**. It generates machine-enforceable AI-agent config (AGENTS.md, CONVENTIONS.md) from ~95 starter principles, each a TOML rule with explicit alternatives and a test for what qualifies. Built to demonstrate how I think about standards-as-code, not as a maintained product.
- Writing - essays on AI-native architecture and standards-as-code: **Architecture as Law, Codifying Less Is More**. Full list at **Medium**.

IV. ELIGIBILITY AND LOCATION

Status: United States Citizen · **Location:** New York City · **Availability:** Fully Remote

V. EDUCATION & CERTIFICATIONS

Microsoft **2022 – 2024**
Azure Developer Associate (AZ-204), Dec 2024 · **Azure Fundamentals (AZ-900)**, June 2022

FullStack Academy **2020 – 2020**
Web Development Certificate New York, NY

Rutgers University **2015 – 2018**
B.S. in Public and Non-Profit Administration Summa Cum Laude
